

EXPRIMENT-2

2.) Write a Python program for monoalphabetic substitution cipher maps a plaintext alphabet to a ciphertext alphabet, so that each letter of the plaintext alphabet maps to a single unique letter of the ciphertext alphabet.

PROGRAM:

```
main.py Visualize Run ▶  
1 alphabet = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"  
2 key = "QWERTYUIOPASDFGHJKLZXCVBNM"  
3  
4 plaintext = input("Enter the plaintext: ")  
5  
6 ciphertext = ""  
7  
8 for letter in plaintext:  
9     if letter in alphabet:  
10         position = alphabet.index(letter)  
11         ciphertext += key[position]  
12     else:  
13         ciphertext += letter  
14  
15 print("Ciphertext:", ciphertext)
```

OUTPUT:

```
Enter the plaintext: HELLO  
Ciphertext: ITSSG
```
